

What is the difference between Kleenoil Onboard Oil Recycling Systems and standard full flow filters?

Standard full flow filters will filter down to the 35-40 micron range, while the Kleenoil Onboard Oil Recycling System will remove particulates down to 1 micron, 3 absolute. The Kleenoil Filter Cartridge will remove 99.95% of all water from the oil, through absorption by the cartridge, as opposed to having to heat the oil to steam water out of it like some competitive products on the market. The Kleenoil Onboard Oil Recycling System refines the oil by removing all contaminants to maintain oil quality and extend additive package life.
